To whom it may concern:

In monitoring Meadowville distribution system last year I was able to make some close observation and form some opinions on the system. First, if the users or the State expect it to be regulated and measured like it was in the 1989 season, it is only fair to the commissioner to have measuring devices and head gates with locks installed at the point of concern in order to make the job effective. Last year I would regulate the Willis ditch and the Sacred ditch and before I would get back home someone would follow behind and undo what had been done.

I would also like to recommend that at the 40th split on Meadowville Creek, when flow drops below 1.5 cfs that it should go on time according to shares.

It seems that when the flow in No. Creek and Little Cheney Spring drops to flow of .2 cfs or less that the only beneficial use would be to let Cooks use it as they see fit including storing it.

Sincerely,

A handwritten signature in cursive script, appearing to read "Dan C. Peart".
